

# UNDERGROUND RECOVERY PLANT BERNBURG

## Recovery process

1. Mining backfill mixtures with defined properties are produced above ground in a processing hall of our partner company AUREC GmbH, among other things by classifying and conditioning.
2. The backfill materials reach an intermediate storage facility several hundred meters underground via a downpipe
3. Vehicles are used to transport them further into the cavities. The backfill material is introduced there and covered with salt.
4. Waste already packed in big bags can be delivered and moved, provided that it meets the recovery requirements.

## Bernburg site

- Recovery process : Tipping backfill
- Installation: 1992
- Acceptance of pneumatically conveyable waste, bulk goods, big bags
